## DETAILED ACTION

### *Claim Rejections - 35 USC § 102*

1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless –

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

2. Claims 1, 3-5 and 9 are rejected under 35 U.S.C. 102(b) as being anticipated by Lim (USP 5,319,265). Figure 4 shows a signal level detection comprising a first DC error amplifier operational (Q1-Q5) to generate a control signal (signal at the collector of the transistor Q4) in response to a reference signal ( $V_{in}$ ) and a feedback signal (signal at the collector of the transistor Q5), and a first inverter (Q7-Q9, IB) operational to generate the feedback signal in response to the first DC error amplifier control signal, wherein the first DC error amplifier control signal operate to set a switching point for the first inverter (the hysteresis of the comparator is determined by the switching point of the inverter (Q7-Q9) as called for in claims 1, 3-5 and 9.
3. Claims 1, 3-5 and 9 are rejected under 35 U.S.C. 102(b) as being anticipated by Lim et al. (USP 5,614,857). Figure 1 shows a signal level detection comprising a first DC error amplifier operational (OP1) to generate a control signal ( $V_{out}$ ) in response to a reference signal ( $V_{in}$ ) and a feedback signal ( $V_{th}$ ), and a first inverter (Q1, R4) operational to generate the feedback signal in response to the first DC error amplifier control signal, wherein the first DC error amplifier control signal operate to set a switching point for the first inverter as called for in claims 1, 3-5 and 9.

Art Unit: 2816

4. Claims 1, 3-5 and 9 are rejected under 35 U.S.C. 102(b) as being anticipated by Chevallier et al. (USP 6,229,352). Figure 2 shows a signal level detection comprising a first DC error amplifier operational (12) to generate a control signal (20) in response to a reference signal (15) and a feedback signal (17), and a first inverter (16) operational to generate the feedback signal in response to the first DC error amplifier control signal, wherein the first DC error amplifier control signal operate to set a switching point for the first inverter as called for in claims 1, 3-5 and 9.

*Allowable Subject Matter*

5. Claims 2, 6-8 and 10-11 are objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.
